*These descriptions are presented as a **guide only** since many variables such as terrain, drainage and intensity can alter the descriptions.*

0.25mm » The first measurable amount of rainfall reported by The National Weather Service. This would not leave puddles on the ground and would slightly wet the surface. Example: A light shower for 2-5 minutes or a drizzle for 2 hours.

2.5mm » A light rain for 30-45 minutes, moderate rain for 10 minutes or heavy rain for 5 minutes. Small puddles would form but usually disappear after a short while.

5.0mm » A light rain for 2-3 hours, moderate rain for 30-60 minutes or heavy rain for 15 minutes. Many puddles on the ground that do not disappear easily.

10.0mm » A light rain never reaches this amount, moderate rain for 1-2 hours or heavy rain for 30-45 minutes. Deep standing water for long periods of time.

15.0mm Heavy rain for 1-2 hours – general saturation

20.0mm Very heavy rain for 1-2 hours

Total Rainfall: The accumulated rainfall over the insured period without taking into account how many times it rains over that period.

Measurements are taken from the closest available Bureau of Meteorology Reading Station as approved by the Insurer.

Please contact the undersigned with any questions or if we may assist further.

Kind Regards
